

## **Making of the Habit Tracking App**

The concept of the Habit Tracking App is to monitor the habits of the user on a daily and weekly basis depending on the periodicity of the habit. The Habit Tracking App also creates a new habit, deletes a habit, edits a habit, imports and exports json file and displays the analytics module.

The solution I came up with for monitoring the habits is by using the datetime library from python, as for storing data I came up with a json file.

To make sure everything is working smoothly, I added a testing file that tests the program.

Everything went well in the end. The monitoring of the habits was the most challenging and important part of the App which I am very proud to create and displaying of the longest streaks after checking off the habits is also something very amazing and astonishing.
